

A short overview of T_EX, its children and their friends

. . .

Arno Trautmann*

September 24, 2010

This paper tries to give a short overview of the development of T_EX. The base frame is taken from the article *A brief history of T_EX*, volume II by Arthur Reutenauer in the proceedings of EuroBachTeX2007 and his talk there (see references). Additional information is taken from original documentations (see references on page 13) and some review articles. For old, historic information, the *historic archive* maintained by Ulrik Vieth and hosted on ftp.tug.org (see refs) was very useful. Many thanks for that great archive!

All information is up to the date of the generated pdf. Everything here is without guarantee – this is just to get an overview. Consult the references for further (and/or correct) information!

In the tree views (page 8), every node has a tooltip that shows up when you hover the mouse over it. If your pdf viewer does not support this, go to the end of the document, where every tooltip is written in normal text (page 15). I tried to make the graph more readable by using colors:

normal (whatever that means)

important developments (only in my opinion) – i. e. engines or distributions that had or have a great impact on (everyday) typesetting for a large community

experimental developments that might still be under construction or were never used by a large community. Nevertheless, these might be very important to the development of other engines or for use of special typesetting.

other programs that are not directly connected to T_EX but are interesting in the overview, are given in black.

Furthermore, there are two versions of each graph: A short version mentioning only the most important things and a full one with everything I could find.

*arno.trautmann@gmx.de – Please feel free to mail me any suggestions and comments!

Contents

1 Tree Views – short view

1.1 T_EX – the program, and extensions/derivatives

1.2 \LaTeX (Lamport's \TeX) – a format and large macro package for \TeX

1.3 ConT_EXt (Context = con tex t – text with tex; formerly pragmatex) – the other major format and T_EX macro package

ConT_EXtMkII

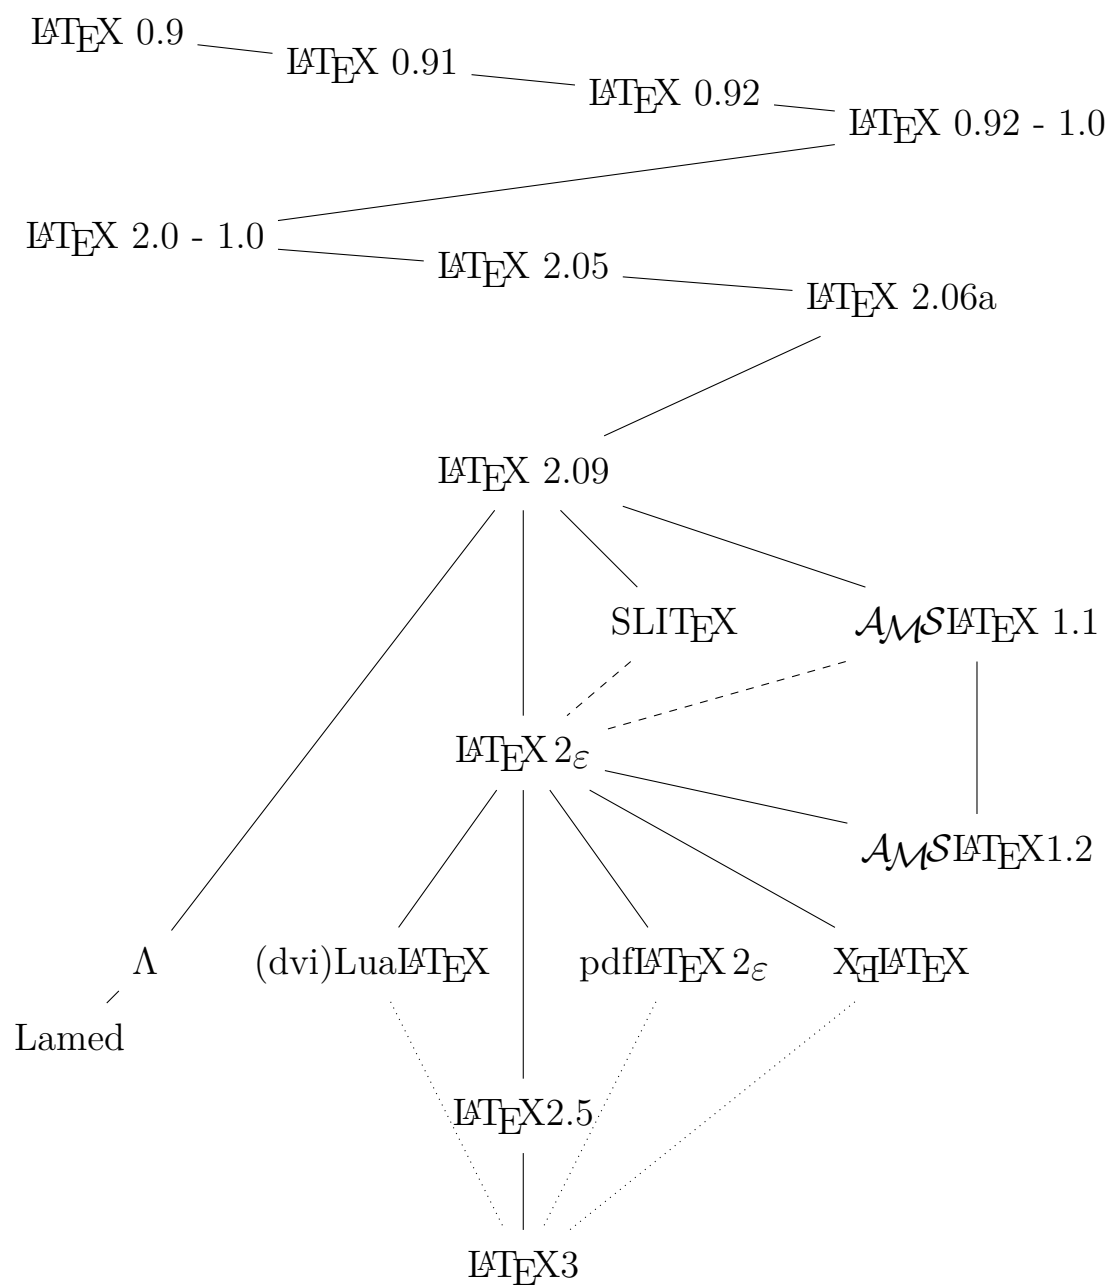

ConT_EXtMkIV

2 Tree Views – full view

2.1 T_EX – the program, and extensions/derivatives

2.2 L^AT_EX (Lamport's T_EX) – a format and large macro package for T_EX

2.3 ConT_EXt (Context = con tex t – text with tex; formerly pragmatex) – the other major format and T_EX macro package

3 Pandora's Box – full view

The following pages will be a hodge-podge of many things that are related to $\text{T}_{\text{E}}\text{X}$ and used in the process of generating documents in different file formats, i. e. conversion tools, bibliography tools etc. Feel free to contribute, I'll choose case-by-case if I'll add something or won't include it. Text editors or viewers will *not* be included!

3.1 $\text{BibT}_{\text{E}}\text{X}$

3.2 dvipdfm

References

The references are in order of occurrence in the above document. I.e. if you want information about LuaTeX, it will be below e.g. ϵ TeX.

4 Text Views – full view

4.1 T_EX – the program, and extensions/derivatives

T_EX

born in 1978

ANT

Ant is Not TeX. A typesetting system inspired by TeX. Only **inspired**, so it has nothing to do with TeX in terms of common code.

T_EX-XET

The first extension to TeX, 1987. It was able to typeset in two directions, but only with a mark in the dvi to change the direction.

T_EX-XET

TeX–XeT was able to really put the glyphs on the right place in the dvi.

T_EX3

Ability to handle 8-bit input. 1989. TeX development was frozen in 1991 and only bugfixes were made. Now it in version 3.1415926, getting closer to pi with every bugfix ...

encT_EX

A small extension to TeX, started 1997. Adds 10 new primitives relating input re-encoding

MLT_EX

Extension (started 1990) to TeX that allows hyphenation of words with accented letters. (Therefore the name: MultiLinal TeX.) Distributed as a change file to the original WEB sources of TeX.

T_EX2PDF

Early name for pdfTeX.

Ω

Support for 16bit-unicode-input. Still constrained on the output

ε-T_EX

the extension to TeX.

pdfT_EX

A new engine to directly produce pdf-files from TeX, without the need of dvi-ps-pdf. This allows to use microtypographic extensions and many other features of the pdf format.

T_EXgX

GX stands for Graphic eXtension, a font technologie TeXGX was able to handle. Only on Mac OS.

NTS

A project to completely reimplement TeX in Java. Now NTS is officially declared dead.

Ω₂

A short-time try to pick up the development of Omega again in 2006. Seemed more like a good plan and is now regarded as obsolete. LuaTeX is kind of a successor.

VT_EX

VT_EX (VisualTe_X) can produce pdf, html, svg, dvi or ps output directly from input. In contrast to pdfTe_X, it includes a full PostScript interpreter, thus capable to include EPS figures, PStricks etc. First official version I found: February 15, 1999: VT_EX 6.3; last official version seems to be from Oct 1, 2005: VT_EX 8.61. Commercial product.

⋈ (Aleph)

originally named epsilon-Omega, an attempt to stabilize Omega while merging epsilon extensions.

X_ETe_X

This extension enables full multilingual support for left-to-right typesetting, right-to-left and almost any other possible direction. XeTe_X also features support for OpenType and AAT-fonts.

εX_ETe_X

Planned implementation of a high-quality typesetting system, written in Java. Based on experiences in NTS, eTe_X, pdfTe_X and Omega. Started in 2003, current version in repository is 0.0. (i. e. not very far ...)

pdf(ε)-Te_EX

Merging the pdfTe_X engine with the eTe_X-extensions. This engine can produce dvi (with or without the eTe_X-extensions) as well as pdf (again, with or without extensions).

eeTe_EX

Experimental extension to pdfTe_X by Taco Hoekwater, created 2000. Distributed as change file.

Lua

Script language; has nothing to do with Te_X!

luaTe_EX

LuaTe_X will support unicode, OpenType and totally everything. TeXlive 2010 ships version 0.60.2. luaTe_X features an embedded scripting language, lua, making it easy to extend so most of the programming can be done in lua instead of Te_X-hackery.

iTe_EX

iTe_X is the official successor of Te_X89, announced by Don Knuth at the TUG conference 2010.

4.2 L^ATe_EX (Lamport's Te_EX) – a format and large macro package for Te_EX

L^ATe_EX 0.9

First version still on web (historic archive, see refs) is 0.9, for use with Te_X 0.95. No installation help found. Apparently one needs the files lplain.tex and latex.tex to create the format.

L^ATe_EX 0.91

Version 0.91 for use with Te_X 0.97 (C) 1983 by Leslie Lamport. Most changes to previous version are in the file lplain.tex.

L^ATe_EX 0.92

First version with the @ as letter for internal names. Seemingly first version with a manual. For use with Te_X Version 0.999999. (no joke, that's the version number given in the latex.tex file!) (C) 1983 by Leslie Lamport, conversion to 0.92 from 0.91 by Arthur Keller.

L^ATe_EX 0.92 - 1.0

Adaption of 0.92 for Te_X version 1.0. (C) 1983 by Leslie Lamport, conversion to 0.92 from 0.91 by Arthur Keller.

ℒ_TE_X 2.0 - 1.0

Seemingly heavy changes compared to 0.92. Version for TeX 1.0. Release of 11 Dec 1983. There were never official versions 1.x

ℒ_TE_X 2.05

No sure information found so far.

ℒ_TE_X 2.06a

Release of version 2.06a of the LaTeX macros. September 1984.

ℒ_TE_X 2.09

The first official version by Leslie Lamport, 1985.

SL_TE_X

A variation of LaTeX2.09 to provide an easy way for producing presentations. In LaTeX2e absorbed as a documentclass (slides).

ℳ^Sℒ_TE_X 1.1

A port of Spivak's AMS- \TeX to LaTeX 2.09, released 1990

ℒ_TE_X 2_ε

June 1994: New release of LaTeX to avoid incompatible dialects of LaTeX 2.09. Introduced by the LaTeX3-Team.

ℳ^Sℒ_TE_X 1.2

A port of version 1.1 to LaTeX 2e by Downes and Jones.

pdfℒ_TE_X 2_ε

The standard LaTeX. If anyone talks about "LaTeX" it is nearly shure to be this package. pdfLaTeX2e produces pdf or dvi output.

X₃ℒ_TE_X

Using the XeTeX engine. There are some special packages that provide easy access to the modern features of XeTeX.

(dvi)Luaℒ_TE_X

LaTeX based on LuaTeX with pdf (standard) or dvi (dviLuaLaTeX) output. LaTeX support for luaTeX is under heavy development to make this machine usable with the format. Work in progress, but already well useable!

Λ

A LaTeX-package for the omega-engine.

Lamed

A LaTeX-package for the aleph-engine.

ℒ_TE_X 2.5

Will Robertson suggested in an interview (see refs) an interim unstable version on the way to LaTeX3 with version number 2.5 that should bring package authors towards using LaTeX3 syntax. This version should be backwards incompatible to LaTeX2e. (This version does not exist in any official plannings, but I liked the idea, so it is mentioned here :))

LaTeX3

The planned successor of LaTeX2e. It is planned to implement a very elaborate low-level programming language. The expl3-package provides an implementation that can be used on top of LaTeX2e. Several LaTeX packages already make heavy use of expl3.

4.3 ConTeXt (Context = con tex t – text with tex; formerly pragmatex) – the other major format and TeX macro package

ConTeXtMkI

Original ConTeXt with Dutch low level interface.

ConTeXtMkII

ConTeXt with English low level interface. Works with any TeX-engine, like LaTeX: TeX, e-TeX, pdfTeX, Aleph, XeTeX, ...

ConTeXt MkIII

Reserved for future use for files supporting XeTeX. Was "skipped" for "practical reasons" (Hans Hagen)

ConTeXtMkIV

Specially designed for LuaTeX.

4.4 BibTeX

BibTeX

A helper program to generate a bibliography list.

BibTeX8

The documentation says: „An 8-bit Implementation of BibTeX 0.99 with a Very Large Capacity“

BibTeXu

A unicode-aware version of BibTeX

biber

A cooler version of unicode-aware BibTeX, designed for (?) use with BibLaTeX

BibLaTeX

A LaTeX package as frontend for biber.

4.5 dvipdfm

dvipdfm(x)

Converts dvi files to pdf files. So far no idea what the „x“ is good for.

xdvipdfmx

Converts xdvi files produced by XeTeX to pdf files. Normally always executed after a XeTeX run, so the user won't notice that an xdvi document was created in between.
